matches\)](#)

Compound Registration is a tool that uses a web browser interface for registering chemical structures. Structures - or compounds in general - are being stored in a tree-like representation in three layers: parent, version and lot:

- **Parent:** is a neutral form of the chemical structure without any isotope, charge, counter-ion, or salt/solvate.
- **Version:** a molecule (neutral or charged) with its isotope, counter-ion or salt/solvate.
- **Lot:** an occurrence of the compound in the company, generally a physical sample.

To login into the application please use the credentials provided by the system administrator:

The Dashboard page will be displayed after login.
