

Add reaction file

First, add a [reaction file](#) that contains the applicable reaction equation:

1. Click on **Open** to browse the file system, or you can draw a new one in place by clicking on button **New**. When the imported reaction file contains multiple reaction definitions, select a reaction from the loaded list. You can narrow down the list of reactions by using the search field at the bottom of the list. Reactor users can enjoy a library of important synthetic organic reactions predesigned by experts ([download the full library](#)).
2. If you want to perform a [reversed reaction](#), check the "Reverse direction" checkbox. In this case, the two sides of the given reaction equation will be swapped: products are taken as reactants and reactants are taken as products.
3. Click on **Next** to continue.
